

"Nexaweb was able to help us deliver significant cost savings while enhancing overall system performance over infrastructure alternatives."

Mike Kistner, CIO and Vice President

"Nexaweb integrates a rich collection of widgets, offering performance and behavior similar to client/server applications. Nexaweb simultaneously leverages and overcomes Web standards."

"Nexaweb has much to offer in its deployment and runtime architecture. Nexaweb offers a significant solution."

"Nexaweb-powered applications offer the richness of a desktop application with the flexibility of the Internet."

Ronald Schmelzer, Senior Analyst

"We are partnering with Nexaweb to deliver leading-edge technology and innovative new solutions."

John Nicolson, Senior Manager, Partner Program

By now, the industry is aware of the many benefits Web Services can offer to today's businesses. At the same time, analysts agree that Web Services still lack a critical piece that will enable end-users to realize those benefits – the Presentation Layer. As Web Services drive new ways to develop, deploy and maintain software, they will in turn demand a way to be exposed to the application's user – a Web Services interface.

Nexaweb is a software platform for building and deploying enterprise-class, Rich Internet Applications. Specifically, Nexaweb allows businesses to combine the performance of client/server applications with the deployment efficiencies of the Internet. Nexaweb offers a Presentation Layer that allows you to bring desktop style interfaces and performance to Web Services. Using Nexaweb's Rich Internet Applications Platform, users can access legacy, Web applications and Web Services via one unified interface.
